

THE DESKTOP UNIT WITH MEMORY FUNCTION

THE PERIOTEST S

THE CONVENIENT DESKTOP UNIT – NOW WITH MEMORY FUNCTION

The Periotest S desktop unit is convenient and easy to operate – ideal both for implantology practices and for periodontologists, orthodontic surgeons, oral and maxillofacial surgeons and also dentists who set the highest standards.

The super-slim handpiece is easy to grip and to position. The Periotest S has a large illuminated display, which shows the measuring results in two different formats: as a whole number (= Periotest value) and with a decimal place for even greater accuracy. Simultaneous audible output of the measurements means that the dentist does not have to turn away from the patient. The measurements are also audible for the patient, so both dentist and patient are able to monitor the success of the treatment. The menu offers a choice of four languages (German, English, French and Spanish).

You can store the measuring results on the memory smart card supplied with the unit: Periotest values of the teeth or implants for each patient plus the date and time of measurement are all saved. All the stored measurements can be called up on the display and sorted by patient number or chronologically for ease of progress monitoring. The Periotest S comes with rechargeable NiCd batteries for cordless operation. The battery level indicator tells you how much charge they have left. A battery charger is also supplied with the unit.
